Chapter 2

Evolution of the Major Programming Languages

Genealogy of Common Languages

Fortran

- Fortran 0: 1954 not implemented
- Fortran I:1957
 - Designed for the new IBM 704, which had index registers and floating point hardware
 - This led to the idea of compiled programming languages, because there was no place to hide the cost of interpretation (no floating-point software)
 - Environment of development
 - Computers were small and unreliable
 - Applications were scientific
 - No programming methodology or tools
 - Machine efficiency was the most important concern

Design Process of Fortran

- Impact of environment on design of Fortran I
 - No need for dynamic storage
 - Need good array handling and counting loops
 - No string handling, decimal arithmetic, or powerful input/output (for business software)

Fortran I Overview

- First implemented version of Fortran
 - Names could have up to six characters
 - Post-test counting loop (DO)
 - Formatted I/O
 - User-defined subprograms
 - Three-way selection statement (arithmetic IF)
 - No data typing statements

Fortran I Overview (continued)

- First implemented version of FORTRAN
 - No separate compilation
 - Compiler released in April 1957, after 18 worker-years of effort
 - Programs larger than 400 lines rarely compiled correctly, mainly due to poor reliability of 704
 - Code was very fast
 - Quickly became widely used

Fortran II

- Distributed in 1958
 - Independent compilation
 - Fixed the bugs

Fortran IV

- Evolved during 1960–62
 - Explicit type declarations
 - Logical selection statement
 - Subprogram names could be parameters
 - ANSI standard in 1966

Fortran 77

- Became the new standard in 1978
 - Character string handling
 - Logical loop control statement
 - IF-THEN-ELSE statement

Fortran 90

- Most significant changes from Fortran 77
 - Modules
 - Dynamic arrays
 - Pointers
 - Recursion
 - CASE statement
 - Parameter type checking

Latest versions of Fortran

- Fortran 95 relatively minor additions, plus some deletions
- Fortran 2003 support for OOP, procedure pointers, interoperability with C
- Fortran 2008 blocks for local scopes, coarrays, Do Concurrent

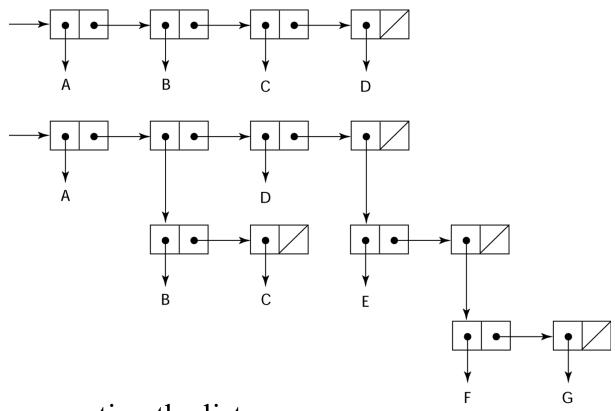

Fortran Evaluation

- Highly optimizing compilers (all versions before 90)
 - Types and storage of all variables are fixed before run time
- Dramatically changed forever the way computers are used

Functional Programming: Lisp

- LISt Processing language
 - Designed at MIT by McCarthy
- Al research needed a language to
 - Process data in lists (rather than arrays)
 - Symbolic computation (rather than numeric)
- Only two data types: atoms and lists
- Syntax is based on lambda calculus

Representation of Two Lisp Lists

Representing the lists (A B C D) and (A (B C) D (E (F G)))

Lisp Evaluation

- Pioneered functional programming
 - No need for variables or assignment
 - Control via recursion and conditional expressions
- Still the dominant language for Al
- Scheme is contemporary dialects of Lisp
- ML, Haskell, and F# are also functional programming languages, but use very different syntax

Scheme

- Developed at MIT in mid 1970s
- Small
- Extensive use of static scoping
- Functions as first-class entities
- Simple syntax (and small size) make it ideal for educational applications

The Beginning of Timesharing: Basic

- Designed by Kemeny & Kurtz at Dartmouth
- Design Goals:
 - Easy to learn and use for non-science students
 - Must be "pleasant and friendly"
 - Fast turnaround for homework
 - Free and private access
 - User time is more important than computer time
- Current popular dialect: Visual Basic
- First widely used language with time sharing

Pascal - 1971

- Developed by Wirth (a former member of the ALGOL 68 committee)
- Designed for teaching structured programming
- Small, simple, nothing really new
- Largest impact was on teaching programming
 - From mid-1970s until the late 1990s, it was the most widely used language for teaching programming

C - 1972

- Designed for systems programming (at Bell Labs by Dennis Richie)
- Powerful set of operators, but poor type checking
- Initially spread through UNIX
- Though designed as a systems language, it has been used in many application areas

Programming Based on Logic: Prolog

- Developed, by Comerauer and Roussel (University of Aix-Marseille), with help from Kowalski (University of Edinburgh)
- Based on formal logic
- Non-procedural
- Can be summarized as being an intelligent database system that uses an inferencing process to infer the truth of given queries
- Comparatively inefficient
- Few application areas

History's Largest Design Effort: Ada

- Huge design effort, involving hundreds of people, much money, and about eight years
- Sequence of requirements (1975–1978)
- Named Ada after Augusta Ada Byron, the first programmer

Ada Evaluation

Contributions

- Packages support for data abstraction
- Exception handling elaborate
- Generic program units
- Concurrency through the tasking model

Comments

- Competitive design
- Included all that was then known about software engineering and language design
- First compilers were very difficult; the first really usable compiler came nearly five years after the language design was completed

Object-Oriented Programming: Smalltalk

- Developed at Xerox PARC, initially by Alan Kay, later by Adele Goldberg
- First full implementation of an objectoriented language (data abstraction, inheritance, and dynamic binding)
- Pioneered the graphical user interface design
- Promoted OOP

Combining Imperative and Object-Oriented Programming: C++

- Developed at Bell Labs by Stroustrup in 1980
- Evolved from C and SIMULA 67
- Facilities for object-oriented programming, taken partially from SIMULA 67
- A large and complex language, in part because it supports both procedural and OO programming
- Rapidly grew in popularity, along with OOP
- ANSI standard approved in November 1997
- Microsoft's version: MC++
 - Properties, delegates, interfaces, no multiple inheritance

A Related OOP Language

- Swift a replacement for Objective–C
 - Released in 2014
 - Two categories of types, classes and struct, like
 C#
 - Used by Apple for systems programs

An Imperative-Based Object-Oriented Language: Java

- Developed at Sun in the early 1990s
 - C and C++ were not satisfactory for embedded electronic devices
- Based on C++
 - Significantly simplified (does not include struct, union, enum, pointer arithmetic, and half of the assignment coercions of C++)
 - Supports only OOP
 - Has references, but not pointers
 - Includes support for applets and a form of concurrency

Java Evaluation

- Eliminated many unsafe features of C++
- Supports concurrency
- · Libraries for applets, GUIs, database access
- Portable: Java Virtual Machine concept, JIT compilers
- Widely used for Web programming
- Use increased faster than any previous language

Scripting Languages for the Web

JavaScript

- Began at Netscape, but later became a joint venture of Netscape and Sun Microsystems
- A client-side HTML-embedded scripting language, often used to create dynamic HTML documents
- Purely interpreted
- Related to Java only through similar syntax

PHP

- PHP: Hypertext Preprocessor, designed by Rasmus Lerdorf
- A server-side HTML-embedded scripting language, often used for form processing and database access through the Web
- Purely interpreted

Scripting Languages for the Web

Python

- An OO interpreted scripting language
- Type checked but dynamically typed
- Used for form processing
- Dynamically typed, but type checked
- Supports lists, tuples, and hashes

Ruby

- Designed in Japan by Yukihiro Matsumoto (a.k.a, "Matz")
- Began as a replacement for Perl and Python
- A pure object-oriented scripting language
 - All data are objects
- Most operators are implemented as methods, which can be redefined by user code
- Purely interpreted

The Flagship .NET Language: C#

- Part of the .NET development platform (2000)
- Based on C++, Java, and Delphi
- Includes pointers, delegates, properties, enumeration types, a limited kind of dynamic typing, and anonymous types
- Is evolving rapidly

Markup/Programming Hybrid Languages

XSLT

- eXtensible Markup Language (XML): a metamarkup language
- eXtensible Stylesheet Language Transformation (XSTL) transforms XML documents for display
- Programming constructs (e.g., looping)

JSP

- Java Server Pages: a collection of technologies to support dynamic Web documents
- JSTL, a JSP library, includes programming constructs in the form of HTML elements
